Holly Technologies Inc. Slow System Repair policies and information.

Start up programs

Start up program are programs that start when your system is booted up and run in the back ground. They are installed with many software packages and you may not even know they exist. Some of the programs are suppose to decrease the amount of time it takes to launch a program or give you a utility on your desktop. However, you may never even use the program. Many of these programs hog resources, slow your system down and can increase boot time.

If you are missing programs some time seen in the system tray (lower right hand corner) they were removed because they were deemed unnecessary for system operation and causing system slow down.

Holly Technologies Inc. tries to remove only programs that hog system resources and slow your system. If you need any of these programs reactivated please contact Holly Technologies Inc. at the below number or bring your system back for reactivation.

Tool Bar Removal

Tool Bars are wonderful things when they are used and setup properly. They allow you to do many things quicker, add short cuts and interesting tools. In many cases however, too many tool bars can interfere with internet operations and cause slow down of your web browser.

Slow down and system compatibility issues happens when several tool bars are installed from separate vendors. If these tool bars have the same tools like pop up blockers or spam filters they can interfere with each other when running at the same time.

When Holly Technologies Inc. evaluates a system for a slow down one thing that is removed, if needed, are tool bars. If you are missing tool bars they were removed due to system or web browsing slow down and or interfering with other programs. If you want to reinstall any tool bar do so with caution and install only the tool bar you want to use. Again installing multiple tool bars can cause severe system problems.
